Nature 390:249-256(1997).

-I FUNCTION: NOT REQUIRED FOR GROWTH OR SPORULATION.

-I SUBCELLULAR LOCATION: Secreted.

-I FTM: PROBABLY UNDERGOES C-TERMINAL PROCESSING OR PROTECLYSIS.

-I SIMILARITY: Belongs to peptidase family S8.

-!- FUNCTION: Subtilisin is an extracellular alkaline serine protease, it catalyzes the hydrolysis of proteins and peptide amides.

-!- CATALYTIC ACTIVITY: Hydrolysis of proteins with broad specificity for peptide bonds, and a preference for a large uncharged residue

C. I- CATALVITC ACTIVITY: Hydrolysis of proteins and peptide amides.

C. CATALVITC ACTIVITY: Hydrolysis of proteins with broad specificity for peptide bonds, and a preference for a large uncharged residue in P1. Hydrolyzes peptide amides.

C. I- COPACTOR: Blinds 1 calcium ion per subunit (Potential).

C. I- SUBCELLULAR LOCATION: Secreted.

C. MISCELLANEOUS: Still active at temperatures close to 0 degrees constituted in has a marked heat lability.

C. MISCELLANEOUS: Secretion of subtilisin is associated with onset of sporulation, and many mutations which block sporulation at early stages affect expression levels of subtilisin. However, subtilisin is not necessary for normal sporulation.

C. SIMILARITY: Belongs to peptidase family S8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. Calcium-mediated thermostability in the subtilisin superfamily: the crystal structure of Bacillus Ak.1 protease at 1.8-A resolution.";
J. Mol. Biol. 294:1027-1040(1999).
-!- COFACTOR: Binds 3 calcium ions and 1 sodium ion per subunit.
-!- SUBCELLULAR LOCATION: Secreted.
-!- MISCELLANEOUS: Has a pH optimum of 8.5, a temperature optimum of 75 degrees Celsius.
-!- SIMILARITY: Belongs to peptidase family SB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.

This invention describes novel Bacillus sp. alkaline proteases useful in detergent compositions, especially in laundry, bleaching or automatic dishwasher detergents. The novel proteases have an increased detergency $ (34 - 38%) compared to prior art alkaline proteases (31 and 23%). This sequence represents a fragment of the alkaline protease A-1 from Bacillus sp NCIB12289 described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 NDVARGIVKADVAQSSYGLYGQGQVVAVADTGLDTGRNDSSMHEAFRGKITAIYALGRTN

The novel proteases have an increased detergency $ (34 - 38 %) compared to prior art alkaline proteases (31 and 22%). This sequence represents a fragment of the alkaline protease KP43 from Bacillus sp strain KSM-KP43 which is used to create the modified protease represented in AAM50090
                                                                                                                                                                                                                                                                                                                                              360

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            566
                                             The invention relates to alkaline proteases produced by strains of Bacillus. The proteases ability to digest casein is not inhibited by claim acid and they have a high stability to oxidising agents. The alkaline protease of the invention has the following properties: (a) it is active over the pH range 4-13 and has at least 80% of its optimum activity over the pH range 6-11; (b) after 30 minutes at 40 deg. C it is stable over the pH range 6-11; c) its isoelectric point is 8.9-9.1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43,000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the enzyme to be an effective component of washing compositions including bleaches. The present sequence represents an alkaline protease. (Updated on 20-MAR-2003 to correct DR field.)

The invention relates to alkaline proceases produced by strains of Bacillus. The proceases ability to digest casein is not inhibited by cleid acid and they have a high stability to oxidising agents. The cleid acid and they have a high stability to oxidising agents. The is active over the pH range 4-13 and has at least 80% of its optimum cativity over the pH range 4-13 and has at least 80% of its optimum catable over the pH range 6-11; (b) after 30 minutes at 40 deg. C it is table over the pH range 6-11; (c) its isoelectric point is 8.9-9.1; (d) its ability to digest casein is not inhibited by oleic acid; (e) it has molecular weight about 43;000 by SDS-PAGE. The alkaline proteases can be used as enzymes in washing compositions for use in automatic dishwashers and for washing clothes. The stability to oxidising agents allows the component sense. The present sequence represents an alkaline protease. (Updated to 20-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             506
